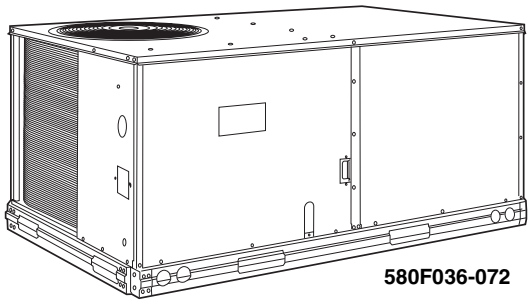
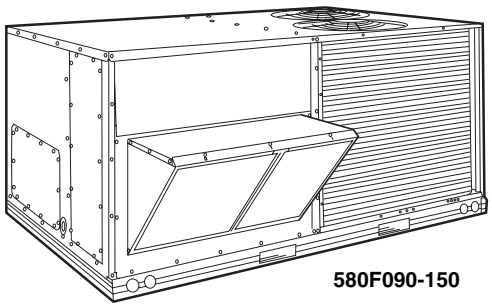
COMMERCIAL SINGLE PACKAGE ROOFTOP GAS HEATING/ELECTRIC COOLING UNITS

Model 580F
The Dura*Pac* Series
Sizes 036-150
3 to 12 1/2 Tons



580F036-072



580F090-150

Standard-Efficiency Rooftop Units with:

- Exclusive integrated gas control board with diagnostics
- Alumagard™ heat exchanger coating
- Induced-draft fan for gas combustion
- Tubular, dimpled heat exchangers
- Pre-painted galvanized steel cabinet for long life and quality appearance
- Commercial strength base rails with built-in rigging capability
- Convertible design for vertical or horizontal supply/return
- Non-corrosive, sloped condensate drain pan, meets ASHRAE 62 (IAQ)
- Two-inch return-air filters (IAQ)
- A wide assortment of factory-installed options available, including high static drives that provide additional performance range
- High and low (loss-of-charge) pressure switches and freezestat
- Refrigerant filter drier

FEATURES/BENEFITS

Every compact one-piece unit arrives fully assembled, charged, tested, and ready to run.

INTEGRATED GAS CONTROLLER (IGC) — All ignition components are contained in the compact IGC which is easily accessible for servicing. The IGC control board provides built-in diagnostic capability. An LED (light-emitting diode) simplifies troubleshooting by providing visual fault notification and system status confirmation.

The IGC also contains an exclusive anti-cycle protection for gas heat operation. After 4 continuous cycles on the unit high-temperature limit switch, the gas heat operation is disabled, and an error code is issued. This feature greatly improves reliability of the rooftop unit.

The IGC also contains burner control logic for accurate and dependable gas ignition. The LED is visible without removing the unit control box access panel. This LED fault-notification system reduces service person troubleshooting time and minimizes service costs. The IGC also maximizes heating efficiency by controlling indoor-fan on and off delays.

QUIET, EFFICIENT OPERATION AND DEPENDABLE PERFORMANCE — Compressors have vibration isolators for quiet operation. Efficient fan and motor design permits operation at low sound levels and all 580F units are mounted either on mounting plate (036-072) or on an exclusive polycore plate (090-150).

The 580F090-150 units offer lower utility costs through part-load operation using 2 stages of cooling.

Quiet and efficient operation is provided by two-speed direct-drive evaporator fans on sizes 036-060 and by belt-driven evaporator fans (on all units). The belt-driven evaporator-fans are equipped with variable-pitch pulleys which allow adjustment within the rpm ranges of the factory-supplied pulleys.

Increased operating efficiency is achieved through computer-designed coils featuring staggered internally enhanced copper tubes. Fins are ripple-edged for strength, lanced, and double waved for higher heat transfer.

Tubular, dimpled gas heat exchangers optimize heat transfer for improved efficiency. The tubular design permits hot gases to make multiple passes across the path of the supply air. The dimpled design creates a turbulent gas flow to maximize heating efficiency.

The California Air Quality Management Districts NO_x requirement of 40 nanograms/joule or less is met on 036-060 size Low NO_x models.

The extra thick Alumagard™ heat exchanger coating provides corrosion resistance and ensures long life. Low NO_x models have 409 stainless steel firing tubes.

The unsightly appearance of flue stacks is eliminated and the effects of wind on heating operations are diminished by the induced draft combustion system. The inducer fan draws hot combustion gas through the heat exchanger at the optimum rate for the most effective heat transfer. The heat exchanger operates under negative pressure, preventing flue gas leakage into the indoor supply air.

During the Heating mode, the evaporator-fan relay automatically starts the evaporator fan after the heat exchanger warms up to a suitable temperature. The 30-second fan delay prevents cold air from entering the supply duct system when the conditioned space is calling for heat to maximize efficiency and comfort.

The direct-spark ignition system saves operating expense when compared to pilot ignition systems. No crossover tube is required, therefore no sooting or pilot fouling problems can occur.

All 580F standard units are designed for natural gas, but an accessory LP (liquid propane) conversion kit is available.

Form No. PDS 580F.36.1

SAFETY IS BUILT IN — All 580F units have a flame rectification sensor to quickly sense the burner flame and ignite burners almost immediately. Fast shutdown is a certainty since the sensor reacts quickly to any flame outage or system failure. In the event of a shutdown, an error code is issued at the IGC board.

Safety is also assured due to the heating safety controls which will shut down the unit if there is a problem. If excessive temperatures develop, limit switches shut off the gas valve. After 4 continuous short cycles of the high-temperature limit switch, the IGC board locks out the gas heat cycle to prevent any further short cycles. The rollout switch also deenergizes the gas valve in the event of a flame rollout.

DURABLE, DEPENDABLE CONSTRUCTION — Designed for durability in any climate, the weather-resistant cabinets are constructed of galvanized steel and bonderized, and all exterior panels are coated with a prepainted baked enamel finish. The paint finish is non-chalking, and is capable of withstanding ASTM B117 500-hour Salt Spray Test. All internal cabinet panels are primed, permitting longer life and a more attractive appearance for the entire unit.

In addition, all 580F units are designed with a single, continuous top piece to eliminate any possible leaks. Totally enclosed condenser-fan motors and permanently lubricated bearings provide additional unit dependability.

EASY INSTALLATION AND CONVERSION — All units are shipped in the vertical duct configuration for fit-up to standard roof curbs. (Two different curb sizes fit unit sizes 036-072 and 090-150, respectively.) The contractor can order and install the roof curb early in the construction stage, before decisions on size requirements are made.

All units feature roll-formed base rail design with forklift slots and rigging holes for easier maneuvering. (Forklift slots are found on 3 sides.) The 580F036-060 base units have operating weights under 500 lb and durable packaging protects all units during shipment and storage.

The units can be easily converted from a vertical to a horizontal duct configuration by relocating the panels supplied with the unit.

The non-corrosive sloped condensate pan permits either an external horizontal side condensate drain (outside the roof curb) or an internal vertical bottom drain (inside the roof curb). Both options require an external, field-supplied P-trap.

The 580F units were designed with service technicians in mind. The single-row condenser coils on the 580F036 and 090 units simplify the cleaning process. The efficient in-shot burners and all ignition components are contained in an easily removable, compact assembly.

The 580F units also have a standard filter access panel, which permits tool-less filter changes, even on units with horizontal economizers.

SIMPLE ELECTRICAL CONNECTIONS — Terminal boards, located in the base unit control box, facilitate connections to room thermostat, outdoor thermostat(s), and economizer. Service panels are quickly removed, permitting easy servicing.

Thru-the-bottom utility connection capability allow power, control wiring, and gas to be routed through unit base pan, minimizing roof penetrations. Gas, power, and control connections are made on the same side of the unit to simplify installation.

In addition, color-coded wires permit easy tracing and diagnostics.

PROVEN COMPRESSOR RELIABILITY — Design techniques feature computer-programmed balance between compressor, condenser, and evaporator. Bryant-specified hermetic compressors are equipped with compressor overcurrent and overtemperature protection to ensure dependability.

All 580F units have a fixed orifice metering device which precisely controls refrigerant flow, preventing slugging and flood-back, while maintaining optimum unit performance. High and low (loss-of-charge) pressure switches, freezestat and refrigerant filter driers are standard.

INTEGRATED ECONOMIZERS AND OUTDOOR AIR — Optional economizers and manual outdoor-air dampers introduce outdoor air which mixes with the conditioned air, improving indoor-air quality and often reducing energy consumption.

During a first stage call for cooling, if the outdoor-air temperature is below the economizer control changeover set point, the discharge-air sensor modulates the economizer outdoor-air damper open to take advantage of free cooling provided by the outside air. When second-stage cooling is called for, the compressor is energized in addition to the economizer. If the outdoor-air temperature is above the changeover set point, the first stage of compression is activated and the economizer stays at vent position. Durablade economizer operation is controlled by a dry-bulb thermostat that senses outdoor-air temperature.

Accessory upgrade kits allow for either outdoor air enthalpy changeover or for more precise differential enthalpy control.

The Durablade economizer (option or accessory) has a reliable sliding plate damper which is easily adjusted for 100% outdoor air, 100% return air, or any proportions of mixed air.

The 580F units can also utilize the factory or field-installed EconoMi$er. The EconoMi$er is microprocessor controlled and incorporates a parallel, opposed-blade gear driven damper system. In addition, it has a spring return built into the damper actuator to provide reliable close-on-power-loss. The EconoMi$er comes equipped with up to 90% barometric relief capability for high outdoor airflow applications. EconoMi$er operation is controlled by a dry-bulb thermostat that senses outdoor air temperature.

Accessory upgrade kits allow for either outdoor air enthalpy changeover or for more precise differential enthalpy control.

In addition, the EconoMi$er two-stage power exhaust accessory can be utilized to help maintain proper building pressure.

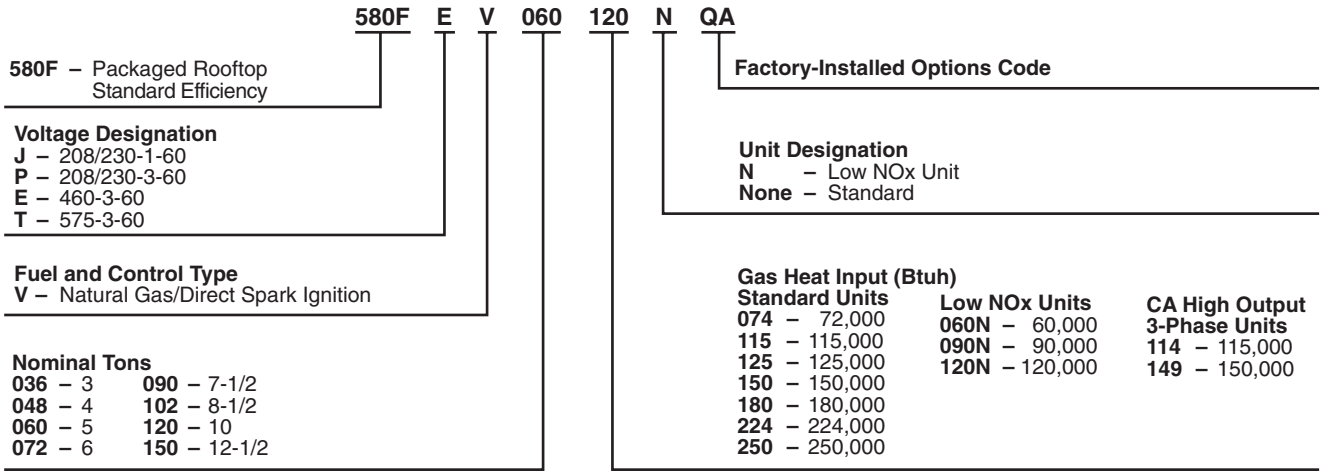
For units without economizer, year-round ventilation is enhanced by a manual outdoor-air damper (ordered as an accessory or an option). The damper can be preset to admit up to 50% outdoor air.

INDOOR-AIR QUALITY BEGINS WITH BRYANT ROOFTOPS — Sloped condensate pans minimize biological growth in rooftop units in accordance with ASHRAE (American Society of Heating, Refrigeration, and Air Conditioning Engineers) Standard 62. Two-inch filters with optional dirty filter indicator switch provide for greater particle reduction in the return air. The face-split evaporator coils (090-150) improve the dehumidification capability of standard units, maximize building humidity control.

Optional proportional reacting CO_2 sensor is available to work with the EconoMi$er to aid IAQ benefits.

TABLE OF CONTENTS

MODEL NUMBER NOMENCLATURE



NOTE: The example model number 558FEV060120NQA designates a 5 ton 460-3-60 volt Low NO_x, gas/electric rooftop unit with 120,000 Btuh natural gas heat, Durablade economizer and alternate drive. Low NO_x units must show the "N" designation in the model number.

ARI* CAPACITY RATINGS

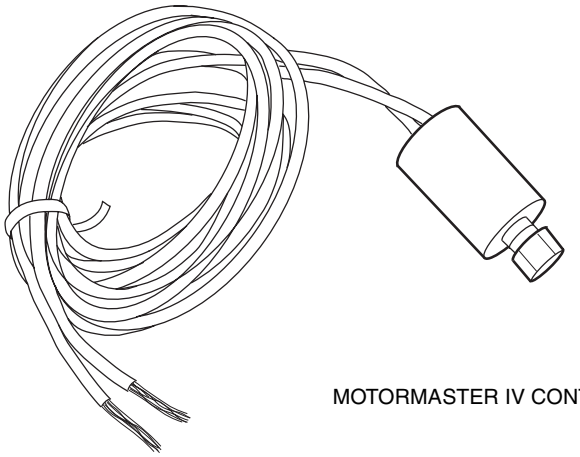
*Factory-installed.
†Field-installed.
**Cannot be used if unit electrical rating exceeds 80 amperes.

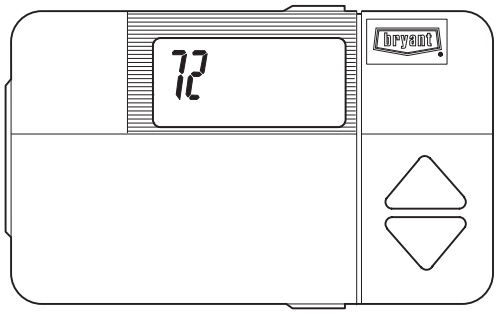
NOTE: Refer to 580F price pages or contact your local representative for accessory/and option package information.

Low Ambient Controls

The 580F standard units are designed to operate in cooling at outdoor temperatures down to 25 F. With accessory Motormaster IV control (condenser-fan cycling) units can operate at outdoor temperatures down to –20 F. The head pressure controls, which mount in the condenser section, control the condenser-fan motor to maintain correct condensing temperature.



MOTORMASTER IV CONTROL



Bryant Commercial Programmable Thermostat

Designed specifically for use with Bryant commercial systems, this Bryant programmable thermostat features LED occupied/unoccupied displays and setback mode which can override continuous fan operation.

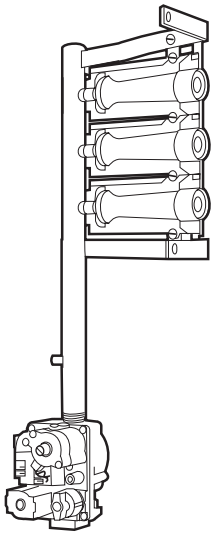
Bryant Light Commercial Thermidistat

The light commercial thermidistat combines temperature control and humidity display in one device and provides continuous fan operation in occupied mode.

Time Guard II Control

Time Guard II control automatically prevents compressor from restarting for at least 5 minutes after a shutdown. Accessory prevents short cycling of compressor if thermostat is changed rapidly. Time Guard II control mounts in the control compartment of unit.

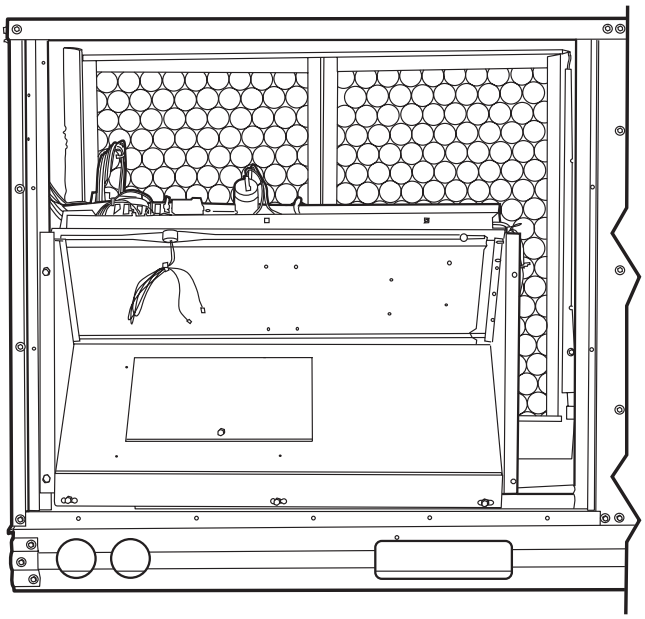
Liquid Propane (LP) Conversion Kits



036-072 SHOWN

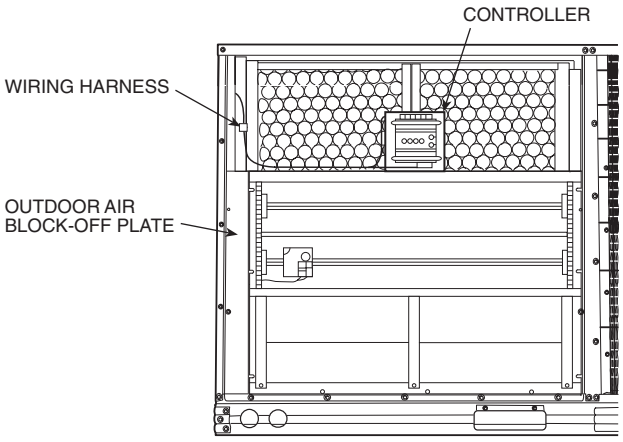
The LP conversion kit allows the unit to utilize a liquid propane fuel supply in areas where natural gas is unavailable, and permits the unit to be converted from natural gas to LP gas use. The kit contains the orifices required for LP operation.

Durablade Economizer



Exclusive Durablade economizer damper design saves energy while providing economical and reliable cooling. A sliding plate on the face of the economizer controls the amount of outdoor air entering the system. Closed, it provides a leakproof seal which prevents ambient air from seeping in or conditioned air from seeping out. It can be adjusted easily for 100% outdoor air or any proportions of mixed air. Like the base unit, the economizer is converted easily for horizontal discharge applications.

EconoMi$er



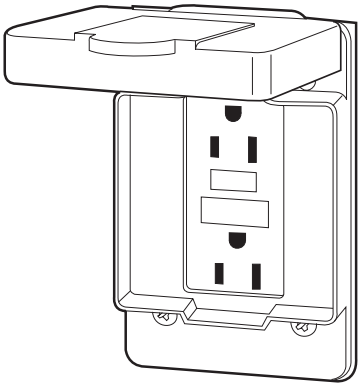
Factory-installed EconoMi$er utilizes a microprocessor-based control, gear drive damper system, low pressure drop characteristics, built-in spring return (for close upon power loss), and an integral barometric damper.

NOTE: EconoMi$er is available for vertical ductwork applications factory installed.

A vertical EconoMi$er, two-stage power exhaust and dedicated horizontal EconoMi$er is available for field installation.

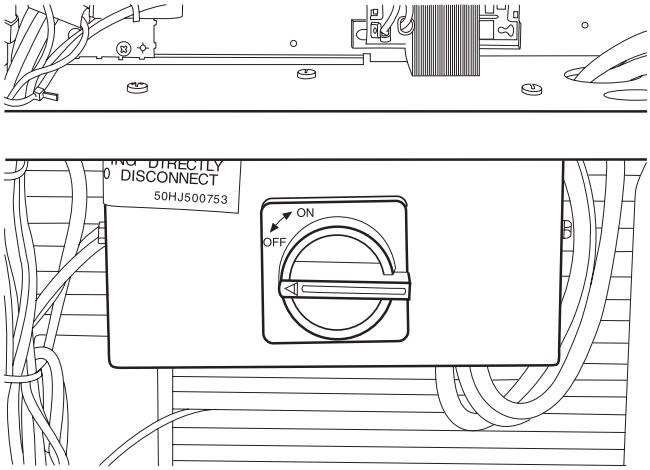
OPTIONS AND ACCESSORIES (cont)

Convenience Outlet



Factory-installed, internally mounted and externally accessible 115-v female receptacle. Includes 15-amp GFI (Ground Fault Interrupter) receptacle with independent fuse protection. Voltage required to operate convenience outlet is provided by a factory-installed transformer.

Unit Mounted Disconnect



Factory-installed, internally-mounted, NEC (National Electrical Code) and UL (Underwriters' Laboratories) approved non-fused switch provides unit power shutoff with disconnect lockout protection capability. The switch is accessible from outside the unit. (Cannot be used if rooftop electrical rating exceeds 80 amperes.)

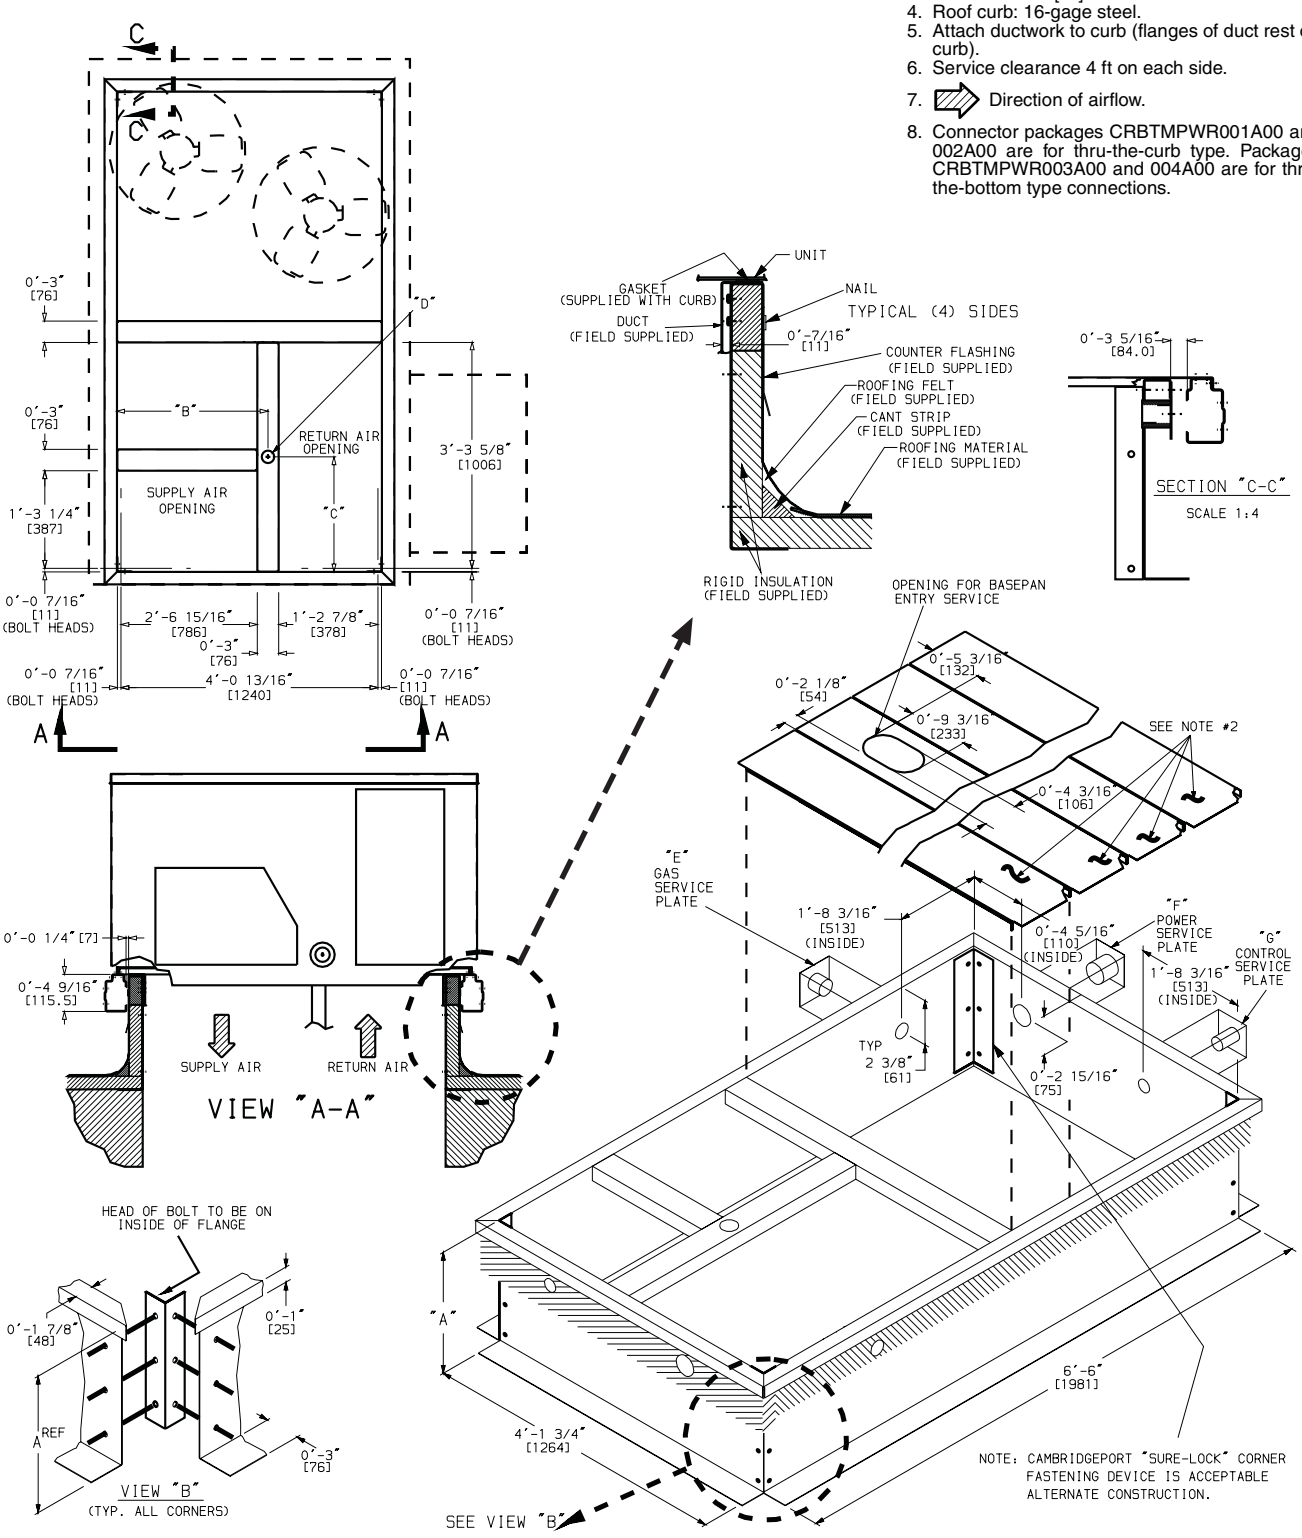
ROOF CURB ACCESSORY	"A"	UNIT SIZE 580F
CRRFCURB003A00	1′-2″ [356]	090-150
CRRFCURB004A00	2′-0″ [610]	

NOTES:
1. Roof curb accessory is shipped disassembled.
2. Insulated panels: 1-in. thick polyurethane foam, 1 3/4 lb density.
3. Dimensions in [ ] are in millimeters.
4. Roof curb: 16-gage steel.
5. Attach ductwork to curb (flanges of duct rest on curb).
6. Service clearance 4 ft on each side.
7. Direction of airflow.
8. Connector packages CRBTMPWR001A00 and 002A00 are for thru-the-curb type. Packages CRBTMPWR003A00 and 004A00 are for thru-the-bottom type connections.



Roof Curb — 580F090-150

SELECTION PROCEDURE (with 580F060 example)

I DETERMINE COOLING AND HEATING REQUIREMENTS AT DESIGN CONDITIONS.

Given:

Required Cooling Capacity (TC) . . . . . 55,000 Btuh
Sensible Heat Capacity (SHC) . . . . . 40,000 Btuh
Required Heating Capacity . . . . . 60,000 Btuh
Condenser Entering Air Temp. . . . . .95 F (Summer)
Evaporator Entering Air Temp. . . . . 80 F edb, 67 F ewb
Evaporator Air Quantity . . . . . .2,000 cfm
External Static Pressure . . . . . 0.6 in. wg
Electrical Characteristics (V-Ph-Hz) 230-3-60

Vertical discharge unit with optional EconoMi$er required.

edb — Entering dry-bulb
ewb — Entering wet-bulb

II SELECT UNIT BASED ON REQUIRED COOLING CAPACITY.

Enter Cooling Capacities table for 580F060 (page 17) at condenser entering temperature 95 F, evaporator air entering at 2,000 cfm and 67 F wb. The 580F060 unit will provide a total cooling capacity of 60,900 Btuh and a sensible heating capacity of 45,300 Btuh. For air entering evaporator at temperatures other than 80 F edb, calculate sensible heat capacity correction as required using the formula in the notes following the Cooling Capacities tables.

NOTE: Unit ratings are gross capacities and do not include the effect of evaporator-fan motor heat. To calculate net capacities, see Step V.

III SELECT HEATING CAPACITY OF UNIT TO PROVIDE DESIGN CONDITION REQUIREMENTS.

In the Heating Capacities and Efficiencies table (page 4) note that the 580F060 074 will provide an output capacity of 59,200 Btuh, which is adequate for the given application.

IV DETERMINE FAN SPEED AND POWER REQUIREMENTS AT DESIGN CONDITIONS.

Before entering the Fan Performance tables, calculate the total static pressure required based on unit components. From the given and the Accessory/FIOP Static Pressure table on page 47 find:

External static pressure	0.60 in. wg
EconoMi$er static pressure	0.27 in. wg
Total Static	0.87 in. wg

Enter standard motor the Fan Performance table 580F060 Vertical Discharge (page 23) at 2,000 cfm and 0.87 in. wg external static pressure. The standard motor cannot provide 0.87 in. wg external static pressure. Enter the alternate motor Fan Performance table for 580F060, vertical discharge. At 2,000 cfm and 0.87 in. wg external static pressure, find that the rpm is 1248, the Bhp is 1.46, and the watts are 1492 (interpolation required).

V DETERMINE NET COOLING CAPACITY.

Cooling capacities are gross capacities and do not include indoor (evaporator) fan motor (IFM) heat. Use the watts input power to the motor calculated in Section IV above.

IFM Watts = 1492

Determine net cooling capacity using the following formula:

Net capacity = Gross capacity – IFM heat
= 60,900 Btuh – 1492 Watts $\left(3.412 \frac{\text{Btuh}}{\text{Watts}}\right)$
= 60,900 Btuh – 5091 Btuh
= 55,809 Btuh

Net sensible capacity = 45,300 Btuh – 5091 Btuh
= 40,209 Btuh

The calculations show that a 580F060 unit with the alternate motor and drive is the correct selection for the given conditions.

BF — Bypass Factor
Edb — Entering Dry-Bulb
Ewb — Entering Wet-Bulb
kW — Compressor Motor Power Input
Ldb — Leaving Dry-Bulb
Lwb — Leaving Wet-Bulb
SHC — Sensible Heat Capacity (1000 Btuh) Gross
TC — Total Capacity (1000 Btuh) Gross

NOTES:

1. Direct interpolation is permissible. Do not extrapolate.
2. The following formulas may be used:

$$t_{ldb} = t_{edb} - \frac{\text{sensible capacity (Btuh)}}{1.10 \times \text{cfm}}$$

t_{lwb} = Wet-bulb temperature corresponding to enthalpy of air leaving evaporator coil (h_{lwb})

$$h_{lwb} = h_{ewb} - \frac{\text{total capacity (Btuh)}}{4.5 \times \text{cfm}}$$

Where: h_{ewb} = Enthalpy of air entering evaporator coil.

3. The SHC is based on 80 F edb temperature of air entering evaporator coil.
   Below 80 F edb, subtract (corr factor x cfm) from SHC.
   Above 80 F edb, add (corr factor x cfm) to SHC.
   Correction Factor = 1.10 x (1 – BF) x (edb – 80).

$$h_{lwb} = h_{ewb} - \frac{\text{total capacity (Btuh)}}{4.5 \times \text{cfm}}$$

Where: h_{ewb} = Enthalpy of air entering evaporator coil.

3. The SHC is based on 80 F edb temperature of air entering evaporator coil.
   Below 80 F edb, subtract (corr factor x cfm) from SHC.
   Above 80 F edb, add (corr factor x cfm) to SHC.
   Correction Factor = 1.10 x (1 – BF) x (edb – 80).

LEGEND

BF — Bypass Factor
Edb — Entering Dry-Bulb
Ewb — Entering Wet-Bulb
kW — Compressor Motor Power Input
Ldb — Leaving Dry-Bulb
Lwb — Leaving Wet-Bulb
SHC — Sensible Heat Capacity (1000 Btuh) Gross
TC — Total Capacity (1000 Btuh) Gross

NOTES:

1. Direct interpolation is permissible. Do not extrapolate.
2. The following formulas may be used:

$$t_{ldb} = t_{edb} - \frac{\text{sensible capacity (Btuh)}}{1.10 \times \text{cfm}}$$

t_{lwb} = Wet-bulb temperature corresponding to enthalpy of air leaving evaporator coil (h_{lwb})

$$h_{lwb} = h_{ewb} - \frac{\text{total capacity (Btuh)}}{4.5 \times \text{cfm}}$$

Where: h_{ewb} = Enthalpy of air entering evaporator coil.

3. The SHC is based on 80 F edb temperature of air entering evaporator coil.
Below 80 F edb, subtract (corr factor x cfm) from SHC.
Above 80 F edb, add (corr factor x cfm) to SHC.
Correction Factor = 1.10 x (1 – BF) x (edb – 80).

Bhp — Brake Horsepower Input to Fan
Esp — External Static Pressure (in. wg)
FIOP — Factory-Installed Option

NOTES:
1. Values include losses for filters, unit casing, and wet coils. See page 47 for accessory/FIOP static pressure information.
2. Extensive motor and electrical testing on these units ensures that the full range of the motor can be utilized with confidence. Using your fan motors up to the wattage ratings shown will not result in nuisance tripping or premature motor failure. Unit warranty will not be affected. See Evaporator-Fan Motor Performance table on page 50 for Additional information.
3. Use of a field-supplied motor may affect wire sizing. Contact your Bryant representative for details.

LEGEND

Bhp — Brake Horsepower Input to Fan
FIOP — Factory-Installed Option
Watts — Input Watts to Motor

*Motor drive range is 835 to 1185 rpm. All other rpms require a field-supplied drive.

NOTES:
1. **Boldface** indicates field-supplied drive is required.
2. ▭ indicates field-supplied motor and drive are required.
3. Values include losses for filters, unit casing, and wet coils. See page 47 for accessory/FIOP static pressure information.
4. Maximum continuous bhp is 1.0 and the maximum continuous watts are 1000. Extensive motor and electrical testing on these units ensures that the full range of the motor can be utilized with confidence. Using your fan motors up to the wattage ratings shown will not result in nuisance tripping or premature motor failure. Unit warranty will not be affected. See Evaporator-Fan Motor Performance table on page 50 for additional information.
5. Use of a field-supplied motor may affect wire sizing. Contact your Bryant representative for details.
6. Interpolation is permissible. Do not extrapolate.

LEGEND

Bhp — Brake Horsepower Input to Fan
FIOP — Factory-Installed Option
Watts — Input Watts to Motor

*Motor drive range is 1300 to 1685 rpm. All other rpms require a field-supplied drive.

NOTES:
1. **Boldface** indicates field-supplied drive is required.
2. ▭ indicates field-supplied motor and drive are required.
3. Values include losses for filters, unit casing, and wet coils. See page 47 for accessory/FIOP static pressure information.
4. Maximum continuous bhp is 2.9 and the maximum continuous watts are 2562. Extensive motor and electrical testing on these units ensures that the full range of the motor can be utilized with confidence. Using your fan motors up to the wattage ratings shown will not result in nuisance tripping or premature motor failure. Unit warranty will not be affected. See Evaporator-Fan Motor Performance table on page 50 for additional information.
5. Use of a field-supplied motor may affect wire sizing. Contact your Bryant representative for details.
6. Interpolation is permissible. Do not extrapolate.

Bhp — Brake Horsepower Input to Fan
FIOP — Factory-Installed Option
Watts — Input Watts to Motor

*Standard drive range is 590 to 840 rpm. Alternate drive range is 685 to 935 rpm. All other rpms require a field-supplied drive.

NOTES:
1. **Boldface** indicates alternate or field-supplied drive is required.
2. ▒ indicates field-supplied motor and drive are required.
3. Values include losses for filters, unit casing, and wet coils. See page 47 for accessory/FIOP static pressure information.
4. Maximum continuous bhp is 2.40 and the maximum continuous watts are 2120. Extensive motor and electrical testing on these units ensures that the full range of the motor can be utilized with confidence. Using your fan motors up to the wattage ratings shown will not result in nuisance tripping or premature motor failure. Unit warranty will not be affected. See Evaporator-Fan Motor Performance table on page 50 for additional information.
5. Use of a field-supplied motor may affect wire sizing. Contact your Bryant representative for details.
6. Interpolation is permissible. Do not extrapolate.

LEGEND

Bhp — Brake Horsepower Input to Fan
FIOP — Factory-Installed Option
Watts — Input Watts to Motor

*Motor drive range is 685 to 935 rpm. All other rpms require a field-supplied drive.

NOTES:
1. **Boldface** indicates field-supplied drive is required.
2. ▒▒▒ indicates field-supplied motor and drive are required.
3. Values include losses for filters, unit casing, and wet coils. See page 47 for accessory/FIOP static pressure information.
4. Maximum continuous bhp is 2.4 and the maximum continuous watts are 2120. Extensive motor and electrical testing on these units ensures that the full range of the motor can be utilized with confidence. Using your fan motors up to the wattage ratings shown will not result in nuisance tripping or premature motor failure. Unit warranty will not be affected. See Evaporator-Fan Motor Performance table on page 50 for additional information.
5. Use of a field-supplied motor may affect wire sizing. Contact your Bryant representative for details.
6. Interpolation is permissible. Do not extrapolate.

LEGEND

Bhp — Brake Horsepower Input to Fan
FIOP — Factory-Installed Option
Watts — Input Watts to Motor

*Standard drive range is 685 to 935 rpm. Alternate motor drive range is 835 to 1085 rpm. High-static motor drive range is 830 to 1130 rpm. All other rpms require a field-supplied drive.

NOTES:
1. **Boldface** indicates optional high-static motor and drive are required.
2. Values include losses for filters, unit casing, and wet coils. See page 47 for accessory/FIOP static pressure information.
3. Maximum continuous bhp is 2.4 for the standard motor, 2.9 for the alternate motor and 5.25 for the high-static motor. Maximum continuous watts are 2120 for the standard motor, 2615 for the alternate motor and 4400 for the high-static motor. Extensive motor and electrical testing on these units ensures that the full range of the motor can be utilized with confidence. Using your fan motors up to the wattage ratings shown will not result in nuisance tripping or premature motor failure. Unit warranty will not be affected. See Evaporator-Fan Motor Performance table on page 50 for additional information.
4. Use of a field-supplied motor may affect wire sizing. Contact your Bryant representative for details.
5. Interpolation is permissible. Do not extrapolate.

LEGEND

Bhp — Brake Horsepower Input to Fan
FIOP — Factory-Installed Option
Watts — Input Watts to Motor

*Standard drive range is 860 to 1080 rpm. Alternate motor drive range is 900 to 1260 rpm. All other rpms require a field-supplied drive.

NOTES:

1. **Boldface** indicates alternate motor and drive are required.
2. Values include losses for filters, unit casing, and wet coils. See page 47 for accessory/FIOP static pressure information.
3. Maximum continuous bhp is 3.70 for the standard motor and 5.25 for the alternate motor. Maximum continuous watts are 3313 for the standard motor and 4400 for the alternate motor. Extensive motor and electrical testing on these units ensures that the full range of the motor can be utilized with confidence. Using your fan motors up to the wattage ratings shown will not result in nuisance tripping or premature motor failure. Unit warranty will not be affected. See Evaporator-Fan Motor Performance table on page 50 for additional information.
4. Use of a field-supplied motor may affect wire sizing. Contact your Bryant representative for details.
5. Interpolation is permissible. Do not extrapolate.

LEGEND

Bhp — Brake Horsepower Input to Fan
FIOP — Factory-Installed Option
Watts — Input Watts to Motor

*Motor drive range is 1075 to 1455 rpm. All other rpms require a field-supplied drive.

NOTES:
1. **Boldface** indicates field-supplied drive is required.
2. Values include losses for filters, unit casing, and wet coils. See page 47 for accessory/FIOP static pressure information.
3. Maximum continuous bhp is 2.4 and maximum continuous watts are 2120. Extensive motor and electrical testing on these units ensures that the full range of the motor can be utilized with confidence. Using your fan motors up to the wattage ratings shown will not result in nuisance tripping or premature motor failure. Unit warranty will not be affected. See Evaporator-Fan Motor Performance table on page 50 for additional information.
4. Use of a field-supplied motor may affect wire sizing. Contact your Bryant representative for details.
5. Interpolation is permissible. Do not extrapolate.

LEGEND

Bhp — Brake Horsepower Input to Fan
FIOP — Factory-Installed Option
Watts — Input Watts to Motor

*Motor drive range is 900 to 1300 rpm. All other rpms require a field-supplied drive.

NOTES:

1. **Boldface** indicates field-supplied drive is required.
2. ▭ indicates field-supplied motor and drive are required.
3. Values include losses for filters, unit casing, and wet coils. See page 47 for accessory/FIOP static pressure information.
4. Maximum continuous bhp is 1.30 for single-phase units and 2.40 for 3-phase units and the maximum continuous watts are 2120. Extensive motor and electrical testing on these units ensures that the full range of the motor can be utilized with confidence. Using your fan motors up to the wattage ratings shown will not result in nuisance tripping or premature motor failure. Unit warranty will not be affected. See Evaporator-Fan Motor Performance table on page 50 for additional information.
5. Use of a field-supplied motor may affect wire sizing. Contact your Bryant representative for details.
6. Interpolation is permissible. Do not extrapolate.

LEGEND

Bhp — Brake Horsepower Input to Fan
FIOP — Factory-Installed Option
Watts — Input Watts to Motor

*Motor drive range is 1300 to 1685 rpm. All other rpms require a field-supplied drive.

NOTES:
1. **Boldface** indicates field-supplied drive is required.
2. ▒▒▒ indicates field-supplied motor and drive are required.
3. Values include losses for filters, unit casing, and wet coils. See page 47 for accessory/FIOP static pressure information.
4. Maximum continuous bhp is 2.9 and the maximum continuous watts are 2562. Extensive motor and electrical testing on these units ensures that the full range of the motor can be utilized with confidence. Using your fan motors up to the wattage ratings shown will not result in nuisance tripping or premature motor failure. Unit warranty will not be affected. See Evaporator-Fan Motor Performance table on page 50 for additional information.
5. Use of a field-supplied motor may affect wire sizing. Contact your Bryant representative for details.
6. Interpolation is permissible. Do not extrapolate.

LEGEND

Bhp — Brake Horsepower Input to Fan
FIOP — Factory-Installed Option
Watts — Input Watts to Motor

*Motor drive range is 860 to 1080 rpm. All other rpms require a field-supplied drive.

NOTES:
1. **Boldface** indicates field-supplied drive is required.
2. ▭ indicates field-supplied motor and drive are required.
3. Values include losses for filters, unit casing, and wet coils. See page 47 for accessory/FIOP static pressure information.
4. Maximum continuous bhp is 3.7 and the maximum continuous watts are 3313. Extensive motor and electrical testing on these units ensures that the full range of the motor can be utilized with confidence. Using your fan motors up to the wattage ratings shown will not result in nuisance tripping or premature motor failure. Unit warranty will not be affected. See Evaporator-Fan Motor Performance table on page 50 for additional information.
5. Use of a field-supplied motor may affect wire sizing. Contact your Bryant representative for details.
6. Interpolation is permissible. Do not extrapolate.

Bhp — Brake Horsepower Input to Fan
FIOP — Factory-Installed Option
Watts — Input Watts to Motor

*Standard motor drive range is 695 to 935 rpm. Alternate motor drive range is 835 to 1085 rpm. High-static motor drive range is 830 to 1130 rpm. All other rpms require a field-supplied drive.

NOTES:

1. **Boldface** indicates field-supplied drive is required.
2. ▭ indicates optional high-static motor and drive are required.
3. Values include losses for filters, unit casing, and wet coils. See page 47 for accessory/FIOP static pressure information.
4. Maximum continuous bhp is 2.4 for the standard motor, 2.9 for the alternate motor and 5.25 for the high-static motor. Maximum continuous watts are 2120 for the standard motor, 2615 for the alternate motor and 4400 for the high-static motor. Extensive motor and electrical testing on these units ensures that the full range of the motor can be utilized with confidence. Using your fan motors up to the wattage ratings shown will not result in nuisance tripping or premature motor failure. Unit warranty will not be affected. See Evaporator-Fan Motor Performance table on page 50 for additional information.
5. Use of a field-supplied motor may affect wire sizing. Contact your Bryant representative for details.
6. Interpolation is permissible. Do not extrapolate.

Bhp — Brake Horsepower Input to Fan
FIOP — Factory-Installed Option
Watts — Input Watts to Motor

*Standard motor drive range is 860 to 1080 rpm. Alternate motor drive range is 900 to 1260 rpm. All other rpms require a field-supplied drive.

NOTES:

1. **Boldface** indicates field-supplied drive is required.
2. Shaded cells indicate alternate motor and drive are required.
3. Values include losses for filters, unit casing, and wet coils. See page 47 for accessory/FIOP static pressure information.
4. Maximum continuous bhp is 3.7 for the standard motor, and 5.25 for the alternate motor. The maximum continuous watts are 3313 for the standard motor and 4400 for the alternate motor. Extensive motor and electrical testing on these units ensures that the full range of the motor can be utilized with confidence. Using your fan motors up to the wattage ratings shown will not result in nuisance tripping or premature motor failure. Unit warranty will not be affected. See Evaporator-Fan Motor Performance table on page 50 for additional information.
5. Use of a field-supplied motor may affect wire sizing. Contact your Bryant representative for details.
6. Interpolation is permissible. Do not extrapolate.

Durablade Economizer Barometric Relief Damper Characteristic — 580F036-150

PERFORMANCE DATA (cont)

EVAPORATOR-FAN MOTOR EFFICIENCY

UNIT 580F	MOTOR EFFICIENCY (%)
036,048	75
060	74/84*
072	84
090-120	80
150	87

*Single phase/three-phase.

NOTE: All indoor-fan motors 5 hp and larger meet the minimum efficiency requirements as established by the Energy Policy Act of 1992 (EPACT) effective October 24, 1997.

ALTITUDE DERATING FACTOR*

ELEVATION (ft)	MAXIMUM HEATING VALUE (Btu/ft^3)
0-2,000	1,100
2,001-3,000	1,050
3,001-4,000	1,000
4,001-5,000	950
5,001-6,000	900

*Derating of the unit is not required unless the heating value of the gas exceeds the values listed in the table above, or if the elevation exceeds 6000 ft. Derating conditions must be 4% per thousand ft above sea level. For example, at 4000 ft, if the heating value of the gas exceeds 1000 Btu/ft^3, the unit will require a 16% derating. For elevations above 6000 ft, the same formula applies. For example, at 7000 ft, the unit will require a 28% derating of the maximum heating value per the National Fuel Gas Code.

LEGEND

BHP — Brake Horsepower

*Extensive motor and electrical testing on these units ensures that the full horsepower range of the motors can be utilized with confidence. Using your fan motors up to the horsepower ratings shown in this table will not result in nuisance tripping or premature motor failure. Unit warranty will not be affected.

†Single phase/three-phase.

NOTES:

1. All indoor-fan motors 5 hp and larger meet the minimum efficiency requirements as established by the Energy Policy Act of 1992 (EPACT) effective October 24, 1997.
2. High-static motor not available on single-phase units.

FLA — Full Load Amps
HACR — Heating, Air Conditioning and Refrigeration
IFM — Indoor (Evaporator) Fan Motor
LRA — Locked Rotor Amps
MCA — Minimum Circuit Amps
MOCP — Maximum Overcurrent Protection
NEC — National Electrical Code
OFM — Outdoor (Condenser) Fan Motor
RLA — Rated Load Amps

*Used to determine minimum disconnect per NEC.
†Fuse or HACR circuit breaker
**Fuse only.

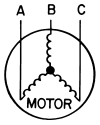
NOTES:

1. In compliance with NEC requirements for multimotor and combination load equipment (refer to NEC Articles 430 and 440), the overcurrent protective device for the unit shall be fuse or HACR breaker. Canadian units may be fuse or circuit breaker.
2. **Unbalanced 3-Phase Supply Voltage**
   Never operate a motor where a phase imbalance in supply voltage is greater than 2%. Use the following formula to determine the percent of voltage imbalance.

   % Voltage Imbalance

   $$= 100 \times \frac{\text{max voltage deviation from average voltage}}{\text{average voltage}}$$

Example: Supply voltage is 460-3-60.



AB = 452 v
BC = 464 v
AC = 455 v

$$\text{Average Voltage} = \frac{452 + 464 + 455}{3}$$

$$= \frac{1371}{3}$$

$$= 457$$

Determine maximum deviation from average voltage.
(AB) 457 – 452 = 5 v
(BC) 464 – 457 = 7 v
(AC) 457 – 455 = 2 v

Maximum deviation is 7 v.

Determine percent of voltage imbalance.

$$\text{\% Voltage Imbalance} = 100 \times \frac{7}{457}$$

$$= 1.53\%$$

This amount of phase imbalance is satisfactory as it is below the maximum allowable 2%.

IMPORTANT: If the supply voltage phase imbalance is more than 2%, contact your local electric utility company immediately.

LEGEND

FLA — Full Load Amps
HACR — Heating, Air Conditioning and Refrigeration
IFM — Indoor (Evaporator) Fan Motor
LRA — Locked Rotor Amps
MCA — Minimum Circuit Amps
MOCP — Maximum Overcurrent Protection
NEC — National Electrical Code
OFM — Outdoor (Condenser) Fan Motor
RLA — Rated Load Amps

*Used to determine minimum disconnect per NEC.
†Fuse or HACR circuit breaker
**Fuse only.

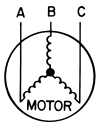
NOTES:

1. In compliance with NEC requirements for multimotor and combination load equipment (refer to NEC Articles 430 and 440), the overcurrent protective device for the unit shall be fuse or HACR breaker. Canadian units may be fuse or circuit breaker.
2. **Unbalanced 3-Phase Supply Voltage**
   Never operate a motor where a phase imbalance in supply voltage is greater than 2%. Use the following formula to determine the percent of voltage imbalance.

   % Voltage Imbalance

   $$= 100 \times \frac{\text{max voltage deviation from average voltage}}{\text{average voltage}}$$

Example: Supply voltage is 460-3-60.



AB = 452 v
BC = 464 v
AC = 455 v

$$\text{Average Voltage} = \frac{452 + 464 + 455}{3}$$

$$= \frac{1371}{3}$$

$$= 457$$

Determine maximum deviation from average voltage.
(AB) 457 – 452 = 5 v
(BC) 464 – 457 = 7 v
(AC) 457 – 455 = 2 v

Maximum deviation is 7 v.

Determine percent of voltage imbalance.

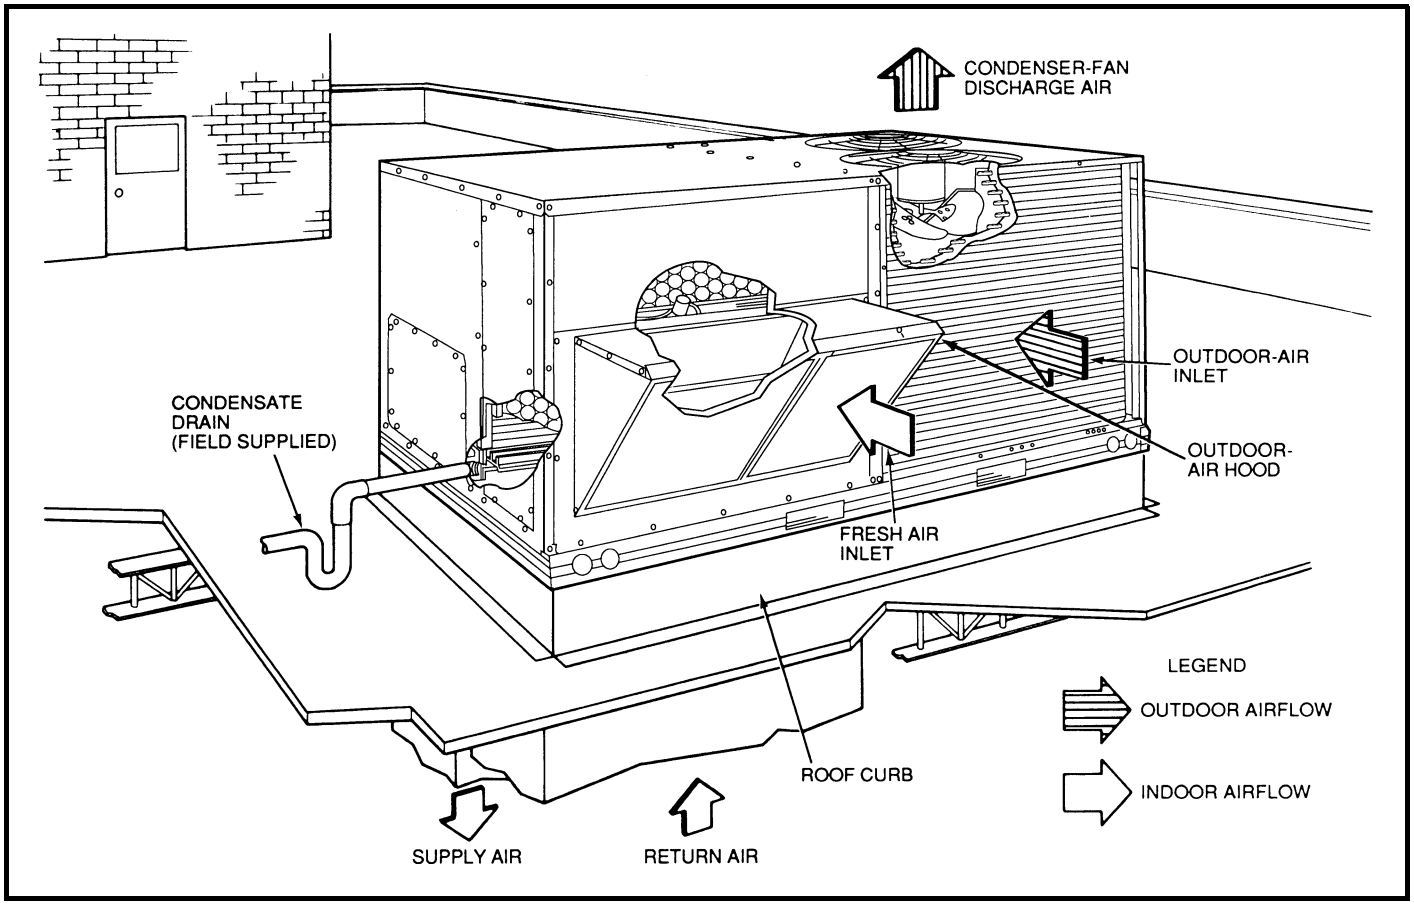
$$\text{\% Voltage Imbalance} = 100 \times \frac{7}{457}$$

$$= 1.53\%$$

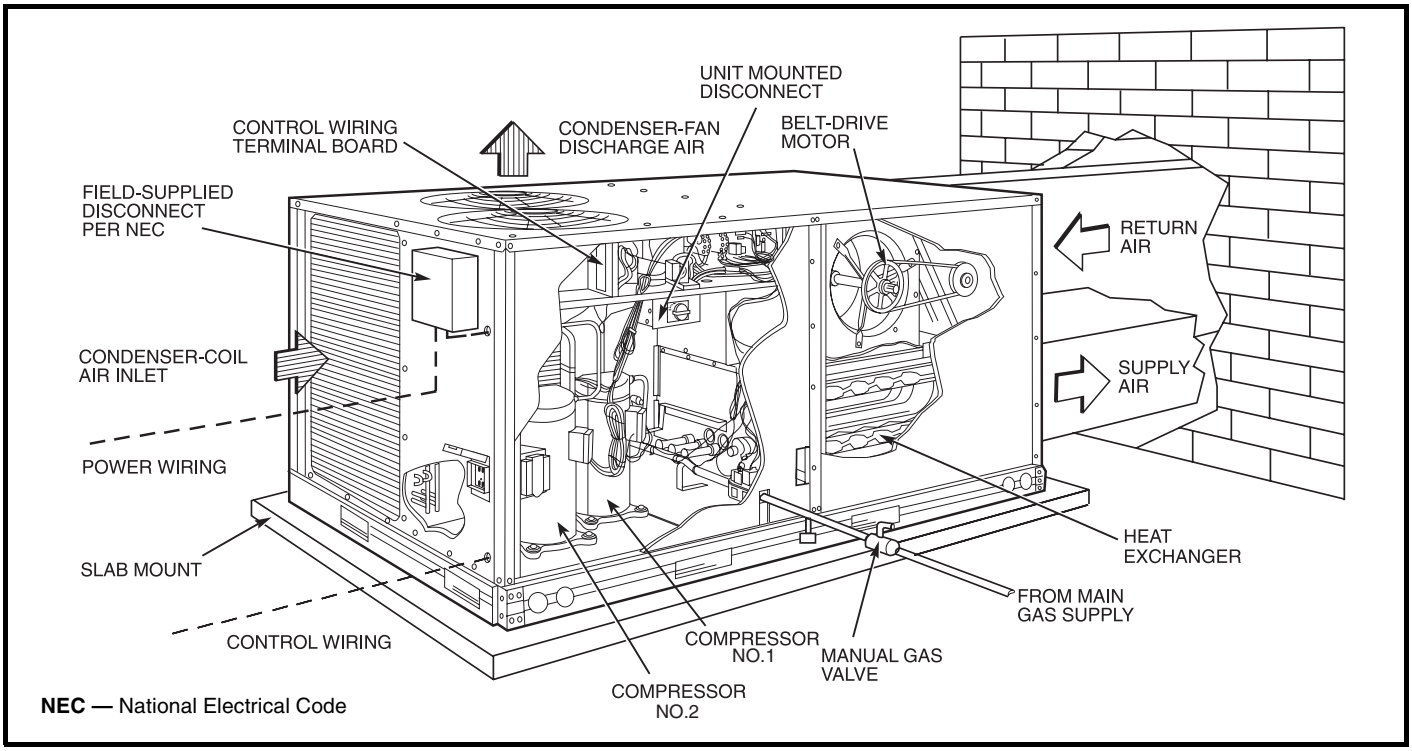
This amount of phase imbalance is satisfactory as it is below the maximum allowable 2%.

IMPORTANT: If the supply voltage phase imbalance is more than 2%, contact your local electric utility company immediately.

TYPICAL PIPING AND WIRING



Vertical Discharge Ducting



NEC — National Electrical Code

Horizontal Discharge Ducting

OPERATING SEQUENCE

Cooling, Units Without Economizer — When thermostat calls for cooling, terminals G and Y1 are energized. The indoor (evaporator) fan contactor (IFC), compressor contactor no. 1 (C1) and outdoor-fan contactor (OFC) are energized, and evaporator-fan motor, compressor no. 1, and both condenser fans start. The condenser-fan motors run continuously while unit is cooling. If the thermostat calls for a second stage of cooling by energizing Y2, compressor contactor no. 2 (C2) is energized and compressor no. 2 starts.

When the thermostat is satisfied, C1 and C2 are deenergized and the compressors and outdoor (condenser) fan motors (OFM) shut off. After a 30-second delay, the indoor (evaporator) fan motor (IFM) shuts off. If the thermostat fan selector switch is in the ON position, the evaporator-fan motor will run continuously.

Heating, Units Without Economizer — When the thermostat calls for heating, terminal W1 is energized. In order to prevent thermostat short-cycling, the unit is locked into the Heating mode for at least 1 minute when W1 is energized. The induced-draft motor (IDM) is then energized and the burner ignition sequence begins. The indoor (evaporator) fan motor (IFM) is energized 45 seconds after a flame is ignited. On units equipped for two stages of heat, when additional heat is needed, W2 is energized and the high-fire solenoid on the main gas valve (MGV) is energized. When the thermostat is satisfied and W1 and W2 are deenergized, the IFM stops after a 45-second time-off delay.

Cooling, Units With Durablade Economizer — When the outdoor-air temperature is above the OAT (outdoor-air thermostat) setting and the room thermostat calls for cooling, compressor contactor no. 1 and outdoor-fan contactor (OFC) are energized to start compressor no. 1 and the outdoor (condenser) fan motors (OFM). The indoor (evaporator) fan motor (IFM) is energized and the economizer damper moves to the minimum position. Upon a further call for cooling, compressor contactor no. 2 will be energized, starting compressor no. 2 (090-150 only). After the thermostat is satisfied, the damper moves to the fully closed position when using an auto fan or to the minimum position when using a continuous fan.

When the outdoor-air temperature is below the OAT setting and the thermostat calls for cooling, the economizer dampers move to the minimum position. If the supply-air temperature is above 57 F, the damper continues to open until it reaches the fully open position or until the supply-air temperature drops below 52 F.

When the supply-air temperature falls to between 57 F and 52 F, the damper will remain at an intermediate open position. If the supply-air temperature falls below 52 F, the damper will modulate closed until it reaches the minimum position or until the supply-air temperature is above 52 F. When the thermostat is satisfied, the damper will move to the fully closed position when using an auto fan or to the minimum position when using a continuous fan.

If the outdoor air alone cannot satisfy the cooling requirements of the conditioned space, economizer cooling is integrated with mechanical cooling, providing second-stage cooling. Compressor no. 1 and the condenser fans will be energized and the position of the economizer damper will be determined by the supply-air temperature. Compressor no. 2 is locked out.

When the second stage of cooling is satisfied, the compressor and OFM will be deenergized. The damper position will be determined by the supply-air temperature.

After a 30-second delay, the IFM shuts off. If the thermostat fan selector switch is in the ON position, the IFM will run continuously.

**Cooling Units With EconoMi$er —** When the OAT is above the ECON SP set point and the room thermostat calls for Stage 1 cooling (R to G + Y1), the indoor-fan motor (IFM) is energized and the EconoMi$er damper modulates to minimum position. The compressor contactor and OFC are energized to start the compressor and outdoor-fan motor (OFM). After the thermostat is satisfied, the damper modulates to the fully closed position when the IFM is deenergized.

When the OAT is below the ECON SP setting and the room thermostat calls for Stage 1 cooling (R to G + Y1), the EconoMi$er modulates to the minimum position when the IFM is energized. The EconoMi$er provides Stage 1 of cooling by modulating the return and outdoor air dampers to maintain a 55 F supply air set point. If the supply-air temperature (SAT) is greater than 57 F, the EconoMi$er modulates open, allowing a greater amount of outdoor air to enter the unit. If the SAT drops below 53 F, the outdoor air damper modulates closed to reduce the amount of outdoor air. When the SAT is between 53 and 57 F, the EconoMi$er maintains its position.

If outdoor air alone cannot satisfy the cooling requirements of the conditioned space, and the OAT is above the MECH CLG LOCKOUT set point, the EconoMi$er integrates free cooling with mechanical cooling. This is accomplished by the strategies below.

NOTE: Compressors have a two-minute Minimum On, Minimum Off, and interstage delay timer.

1. If Y1 is energized, and the room thermostat calls for Y2 (2-stage thermostat), the compressor and OFC are energized. The position of the EconoMi$er damper is maintained at its current value.
2. If Y1 is energized for more than 20 minutes, and Y2 is not energized (whether or not a 2-stage thermostat is used), the compressor and OFC are energized. The position of the EconoMi$er damper is maintained at its current value.
3. If Y1 is energized, and compressor no. 1 is already energized (see Step 2) and the room thermostat calls for Y2, compressor no. 1 continues to operate. If Y2 remains energized for more than 20 minutes, compressor no. 2 is energized (090-150 only).

NOTE: Compressor no. 2 cannot be energized unless there is a signal for Y2 from the space thermostat.

4. If compressor no. 2 is energized, and the Y2 signal from the thermostat is satisfied, compressors 1 and 2 are deenergized. Re-asserting Y2 will start compressor no. 1 and (after a 20-minute interstage delay) compressor no. 2.
5. If compressor no. 1 is energized and the thermostat is satisfied, compressor no. 1, the OFM, and IFM are deenergized and the EconoMi$er modulates closed.

When the OAT is below the MECH CLG LOCKOUT set point, the compressors remain off.

APPLICATION DATA

1. **DUCTWORK —** Secure vertical discharge ductwork to roof curb. For horizontal discharge applications, attach ductwork to unit, or field-supplied flanges can be attached to horizontal discharge openings and all ductwork attached to flanges.
2. **TO CONVERT DURABLADE ECONOMIZER FROM VERTICAL DISCHARGE TO HORIZONTAL DISCHARGE:**
   a. Remove economizer to gain access to return duct opening.
   b. Move the horizontal discharge duct opening covers to the vertical discharge openings.
   c. Rotate economizer 90 degrees (until the economizer motor faces the condenser section).
   d. Rotate the barometric relief damper 90 degrees (economizer only).
   e. Install block-off plate over the opening on the access panel.
3. **THRU-THE-BOTTOM UTILITY CONNECTIONS —** An accessory kit is required for proper installation of thru-the-bottom connections.
4. **THERMOSTAT —** Use of 2-stage cooling thermostat is recommended for all units. A 2-stage cooling thermostat is required on units with accessory economizer to provide integrated cooling.
5. **HEATING-TO-COOLING CHANGEOVER —** All units are automatic changeover from heating to cooling when automatic changeover thermostat and subbase are used.
6. **AIRFLOW —** Units are draw-thru on cooling and blow-thru on heating.
7. **HORIZONTAL ECONOMI$ER —** A field-installed accessory for horizontal discharge applications. Field-installed power exhaust accessory also available for vertical or horizontal EconoMi$er applications.
8. **MAXIMUM AIRFLOW —** To minimize the possibility of condensate blow-off from evaporator, airflow through units should not exceed 500 cfm/ton.
9. **MINIMUM AIRFLOW —** The minimum airflow for cooling is 300 cfm/ton.
10. **MINIMUM AMBIENT COOLING OPERATION TEMPERATURE —** The cooling temperature for size 036-150 standard units is 25 F. With accessory Motormaster® IV control and field-supplied wind baffles, units can operate at outdoor temperatures down to –20 F.
11. **MAXIMUM OPERATING OUTDOOR-AIR TEMPERATURE —** For cooling, this temperature is 115 F.
12. **HIGH ALTITUDE —** A change to the gas orifice may be required at high altitudes. Refer to Altitude Compensation charts on page 48.
13. **MINIMUM TEMPERATURE —** Air entering the heat exchanger in heating must be a minimum of 50 F continuous and 45 F intermittent.
14. **INTERNAL UNIT DESIGN —** Due to Bryant's internal unit design (draw-thru over the motor), air path, and specially designed motors, the full horsepower (maximum continuous bhp) listed in the Physical Data table and the notes following each Fan Performance table can be utilized with extreme confidence.

    Using Bryant motors with the values listed in the Physical and Fan Performance Data tables *will not* result in nuisance tripping or premature motor failure. The unit warranty will not be affected.

PACKAGED ROOFTOP ELECTRIC COOLING UNIT WITH GAS HEAT — CONSTANT VOLUME APPLICATION

HVAC GUIDE SPECIFICATIONS

SIZE RANGE: 3 TO 121/2 TONS, NOMINAL (COOLING) 60,000 TO 250,000 BTUH, NOMINAL (INPUT HEATING)

MODEL NUMBER: 580F

PART 1 — GENERAL

1.01 SYSTEM DESCRIPTION

Outdoor rooftop mounted, electrically controlled heating and cooling unit utilizing a hermetic compressor(s) for cooling duty and gas combustion for heating duty. Unit shall discharge supply air vertically or horizontally as shown on contract drawings.

1.02 QUALITY ASSURANCE

A. Unit shall be rated in accordance with ARI Standards 210/240 or 360 and 270. Designed in accordance with UL Standard 1995.

B. Unit shall be designed to conform to ASHRAE 15, latest revision.

C. Unit shall be UL-tested and certified in accordance with ANSI Z21.47 Standards and UL-listed and certified under Canadian standards as a total package for safety requirements.

D. Roof curb shall be designed to conform to NRCA Standards.

E. Insulation and adhesive shall meet NFPA 90A requirements for flame spread and smoke generation.

F. Unit casing shall be capable of withstanding 500-hour salt spray exposure per ASTM B117 (scribed specimen).

G. Unit shall be designed in accordance with ISO 9001, and shall be manufactured in a facility registered to ISO 9002/BS5750, Part 2.

H. Each 580F unit is subjected to completely automated run testing on the assembly line. Each unit contains a factory-supplied printout indicating tested pressures, amperages, data, and inspectors; providing certification of the unit status at the time of manufacture.

1.03 DELIVERY, STORAGE, AND HANDLING

Unit shall be stored and handled per manufacturer's recommendations.

PART 2 — PRODUCTS

2.01 EQUIPMENT (STANDARD)

A. General:

Factory assembled, single-piece heating and cooling unit. Contained within the unit enclosure shall be all factory wiring, piping, controls, refrigerant charge (R-22), and special features required prior to field start-up.

B. Unit Cabinet:

1. Unit cabinet shall be constructed of galvanized steel, and shall be bonderized and coated with a pre-painted baked enamel finish on all externally exposed surfaces.
2. Evaporator fan compartment interior cabinet surfaces shall be insulated with a minimum $^1/_2$-in. thick, flexible fiberglass insulation, coated on the air side. Aluminum foil-faced fiberglass insulation shall be used in the gas heat compartment.
3. Cabinet panels shall be easily removable for servicing.
4. Holes shall be provided in the base rails for rigging shackles to facilitate maneuvering and overhead rigging.
5. Unit shall have a factory-installed, sloped condensate drain pan made of a non-corrosive material, providing a minimum $^5/_8$-in. connection with both vertical and horizontal drains, and shall comply with ASHRAE Standard 62.
6. Unit shall have a factory-installed filter access panel to provide filter access with tool-less removal.
7. Unit shall have standard thru-the-bottom gas and power connection capability (accessory kit is required).

C. Fans:

1. Evaporator Fan:
   a. Fan shall be direct or belt driven as shown on the equipment drawings. Belt drive shall include an adjustable-pitch motor pulley.
   b. Fan wheel shall be double-inlet type with forward-curved blades.
   c. Bearings shall be sealed, permanently lubricated ball-bearing type for longer life and lower maintenance.
2. Evaporator fan shall be made from steel with a corrosion-resistant finish and shall be dynamically balanced.
3. Condenser fan shall be of the direct-driven propeller type and shall discharge air vertically.
4. Condenser fan shall have aluminum blades riveted to corrosion-resistant steel spiders and shall be dynamically balanced.
5. Induced-draft blower shall be of the direct-driven, single inlet, forward-curved centrifugal type, made from steel with a corrosion-resistant finish and shall be dynamically balanced.

D. Compressor(s):

1. Fully hermetic type, internally protected.
2. Factory mounted on rubber grommets and internally spring mounted for vibration isolation.
3. On independent circuits (090-150).

E. Coils:

1. Evaporator and condenser coils shall have aluminum plate fins mechanically bonded to copper tubes with all joints brazed.
2. Tube sheet openings shall be belled to prevent tube wear.
3. Evaporator coil shall be of the full face active design (036-072) or face-split design (090-150) which proves effective in removing additional moisture from the supply air.

F. Heating Section:

1. Induced-draft negative pressure combustion type with energy saving direct-spark ignition system and redundant main gas valve.
2. The heat exchanger shall be of the tubular-section type constructed of a minimum of 20-gage steel coated with a nominal 1.2 mil aluminum-silicone alloy for corrosion resistance. Low NO_x models have 409 stainless steel primary firing tubes.
3. Burners shall be of the in-shot type constructed of aluminum-coated steel.
4. All gas piping shall enter the unit cabinet at a single location.
5. The integrated gas controller (IGC) board shall include gas heat operation fault notification using an LED (light-emitting diode).
6. Unit shall be equipped with anti-cycle protection with one short cycle on unit flame rollout switch or 4 continuous short cycles on the high-temperature limit switch. Fault indication shall be made using an LED.

7. The IGC board shall contain algorithms that modify evaporator-fan operation to prevent future cycling on high-temperature limit switch.
8. The LED shall be visible without removal of control box access panel.

G. Refrigerant Components:

Refrigerant circuit components shall include:

1. Fixed orifice metering system.
2. Refrigerant filter drier.
3. Service gage connections on suction, discharge, and liquid lines.

H. Filter Section:

1. Standard filter section shall consist of factory-installed, low velocity, throwaway 2-in. thick fiberglass filters of commercially available sizes.
2. Filter face velocity shall not exceed 320 fpm at nominal airflows.
3. Filter section should use only one size filter.
4. Filters shall be accessible through an access panel with “no-tool” removal.

I. Controls and Safeties:

1. Unit Controls:

   Unit shall be complete with self-contained low-voltage control circuit protected by an auto-reset device.
2. Refrigerant Controls:

   Unit shall contain high-pressure, loss-of-charge (low pressure) and freeze protection switches.
3. Safeties:
   a. Unit shall incorporate compressor overtemperature and overcurrent safety devices to shut off compressor.
   b. Heating section shall be provided with the following minimum protections:
      1) High-temperature limit switch.
      2) Induced-draft motor speed sensor.
      3) Flame rollout switch.
      4) Flame proving controls.

J. Operating Characteristics:

1. Unit shall be capable of starting and running at 115 F ambient outdoor temperature, meeting maximum load criteria of ARI Standard 210/240 or 360.
2. Compressor with standard controls shall be capable of operation down to 25 F ambient outdoor temperature.

K. Electrical Requirements:

All unit power wiring shall enter unit cabinet at a single factory-predrilled location.

L. Motors:

1. Compressor motors shall be cooled by refrigerant gas passing through motor windings and shall have line break thermal and current overload protection.
2. Evaporator-fan motor shall have permanently lubricated bearings and inherent automatic-reset thermal overload protection.
3. Totally enclosed condenser-fan motor shall have permanently lubricated bearings, and inherent automatic-reset thermal overload protection.
4. Induced-draft motor shall have permanently lubricated sealed bearings and inherent automatic-reset thermal overload protection.

M. Special Features:

Certain features are not applicable when the features designated * are specified. For assistance in amending the specifications, contact your local Bryant Sales Office.

1. Roof Curbs (Horizontal and Vertical):
   a. Formed galvanized steel with wood nailer strip and shall be capable of supporting entire unit weight.
   b. Permits installation and securing of ductwork to curb prior to mounting unit on the curb.

* 2. Integrated Economizers:
   a. Integrated integral modulating type capable of simultaneous economizer and compressor operation.
   b. Includes all hardware and controls to provide cooling with outdoor air.
   c. Equipped with low-leakage dampers, not to exceed 3% leakage at 1 in. wg pressure differential (Durablade economizer only).
   d. Capable of introducing up to 100% outdoor air.
   e. EconoMi$er shall be equipped with a barometric relief damper with up to 100% of return air (036-072) or 90% of return air (090-150) relief. The Durablade economizer is equipped with 30% of return-air relief (036-150).
   f. Designed to close damper during loss-of-power situations with emergency power supply (Durablade economizer) or spring return built into actuator (EconoMi$er).
   g. Dry bulb outdoor-air temperature sensor shall be provided as standard. Enthalpy control shall be provided as an option.
   h. Durablade economizer is a guillotine-style damper, and the EconoMi$er is a gear-driven parallel blade design.
   i. EconoMi$er shall provide control of internal building pressure through its accessory two-stage power exhaust function.
   j. EconoMi$er shall be capable of exhausting up to 100% outdoor air.

   NOTE: EconoMi$er is available with field-installed power exhaust accessory for vertical or horizontal ductwork applications.

* 3. Manual Outdoor-Air Damper:

Manual damper package shall consist of damper, birdscreen, and rainhood which can be preset to admit up to 50% outdoor air for year-round ventilation.

* 4. 100% Two-Position Damper:
   a. Two-position damper package shall include single blade damper and motor. Admits up to 100% outdoor air.
   b. Damper shall close upon indoor (evaporator) fan shutoff.
   c. Designed to close damper during loss of power situations.
   d. Equipped with 15% barometric relief damper.

* 5. 25% Two-Position Damper:
   a. Two-position damper package shall include single blade damper and motor. Admits up to 25% outdoor air.
   b. Damper shall close upon indoor (evaporator) fan shutoff.

6. Solid-State Enthalpy Control:
   a. For use with Durablade economizer package only.
   b. Capable of sensing outdoor-air enthalpy content (temperature and humidity) and controlling economizer cut-in point to have minimum heat content air passing over the evaporator coil for most efficient system operation.

7. Head Pressure Control Package:
   Consists of solid-state control and condenser-coil temperature sensor to maintain condensing temperature between 90 F and 110 F at outdoor ambient temperatures down to –20 F by condenser-fan speed modulation or condenser-fan cycling.
8. LP (Liquid Propane) Conversion Kit:
   Package shall contain all the necessary hardware and instructions to convert a standard natural gas unit for use with liquefied propane.
9. Electronic Programmable Thermostat:
   Capable of using deluxe full-featured electronic thermostat. Shall use built-in compressor cycle delay control for both heating and cooling duty.
10. Light Commercial Thermidistat:
    Shall regulate temperature and display humidity from one location. Displays outdoor temperature from outdoor temperature sensor.
11. Flue Shield:
    Provides protection from the hot sides of the gas flue hood.
12. Thermostat and Subbase:
    Provides staged cooling and heating automatic (or manual) changeover, fan control, and indicator light.
13. Condenser Coil Hail Guard Assembly:
    Hail guard shall protect against damage from hail and flying debris.

* 14. Unit-Mounted, Non-Fused Disconnect Switch:
    Shall be factory-installed, internally mounted. NEC and UL approved non-fused switch shall provide unit power shutoff. Shall be accessible from outside the unit and shall provide power off lockout capability. Not to be used when rooftop electrical rating exceeds 80 ampheres.

* 15. Convenience Outlet:
    Shall be factory-installed and internally-mounted with easily accessible 115-v female receptacle. Shall include 15 amp GFI receptacle with independent fuse protection. Voltage required to operate convenience outlet shall be provided by a factory-installed step-down transformer. Shall be accessible from outside the unit.

* 16. Alternate Motor(s) and/or Drive(s) (036-060, 090, 120, 150):
    Alternate motor(s) and drive(s) shall be factory-installed to provide additional performance range of indoor blower.

* 17. High-Static Motor(s) and Drive(s) (036-120):
    High-static motor(s) and drive(s) shall be factory-installed to provide additional performance range of indoor blower.

18. Flue Discharge Deflector:
    Flue discharge deflector directs unit exhaust vertically instead of horizontally.
19. Condenser Coil Grille:
    The grille protects the condenser coil from damage by large objects without increasing unit clearances.
20. Compressor Cycle Delay:
    Unit shall be prevented from restarting for minimum of 5 min. after shutdown.
21. Thru-the-Bottom Utility Connectors:
    Kit shall provide connectors to permit gas and electrical connections to be brought to the unit through the basepan.
22. Fan/Filter Status Switch:
    Provides status of indoor (evaporator) fan (ON/OFF) or filter (CLEAN/DIRTY). Status shall be displayed when used with an indicator light at the thermostat.
23. EconoMi$er and Power Exhaust:
    Package shall provide control of internal building pressure. The two-stage system shall exhaust up to 100% of return air. (Accessory for vertical applications only.)
24. Two-Stage Power Exhaust Accessory for EconoMi$er:
    Power exhaust shall be used in conjunction with EconoMi$er to provide system exhaust of up to 100% of return air. The power exhaust is a field-installed accessory (vertical and horizontal applications).
25. Outdoor Air Enthalpy Sensor:
    The outdoor air enthalpy sensor shall be used with the EconoMi$er device to provide single enthalpy control. When used in conjunction with a return air enthalpy sensor, the EconoMi$er device will provide differential enthalpy control. The sensor allows the EconoMi$er controller to determine if outside air is suitable for free cooling.
26. Return Air Enthalpy Sensor:
    The return air enthalpy sensor shall be used with the EconoMi$er device. When used in conjunction with an outdoor air enthalpy sensor, the EconoMi$er device will provide differential enthalpy control.
27. Return Air Temperature Sensor:
    The return air temperature sensor shall be used with the EconoMi$er device. When used in conjunction with the standard outdoor air temperature sensor, the EconoMi$er device will provide differential temperature control.
28. Indoor Air Quality (CO_2) Sensor:
    a. Shall have the ability to provide demand ventilation indoor air quality (IAQ) control through the economizer with a CO_2 sensor.
    b. The CO_2 sensor shall be available in wall mount with LED display. The CO_2 sensor can be duct mounted with accessory aspirator box. The set point shall have adjustment capability.
