

THREE-WAY IN-WALL SHOWER DIVERTER

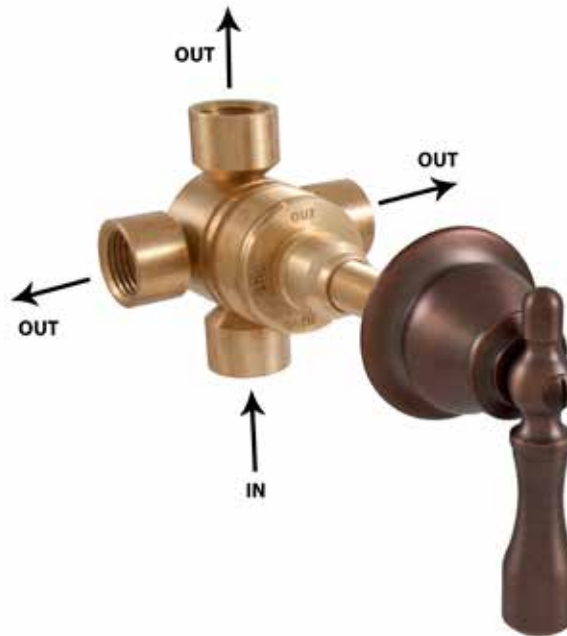

ADDITIONAL INFORMATION

Your new three-way in-wall shower diverter is able to connect to up to three different outputs. You can select a combination of shower heads, body sprays and hand showers to create your own customized shower system. If only two outputs are desired, simply close the third output with a threaded brass plug (provided).

The three-way diverter allows you to alternate between any of your selected shower outputs by directing the water from the shower head to each additional accessory, one at a time. The diverter will not adjust the water temperature or turn the water off or on.

All rough-in work should be completed by a professional. Some of our three-way shower diverters come with an adjustable stem. These diverters can be adjusted to the appropriate length by trimming with a hack saw.

This diverter is included in many of our shower systems, or can be purchased separately and combined with any tub and shower faucet or in-wall shower.

ROUGH-IN INFORMATION

Drawing is based on a 2 x 4 stud wall, covered by 1/2" cement board, 1/8" of thin set tile mortar, and a finished tile of 1/4" thickness.

Please Note: If the wall dimensions are different than the dimensions shown in this diagram, an adjustment to the installation will be required. Complete installation, verifying finished wall depth, BEFORE cutting the stem and all-thread tub to length.
